Football Player Registration Using Python Tkinter

Description:

The Football Player Registration System is a Python-based desktop application developed using the Tkinter library to efficiently manage football player records. The system provides a simple and user-friendly graphical interface where users can register players by entering details such as player name, player ID, age, position, jersey number, and team.

The application includes important features like input validation, duplicate player ID detection, clearing entered data, and displaying registered player records in an organized and sorted format. This project helps reduce manual record management and provides an easy digital solution for storing and accessing football player information efficiently.

Code Snippets:

```
import tkinter as tk
from tkinter import ttk, messagebox

players = []

def clear():
    for e in [name, pid, age, jersey]:
        e.delete(0, tk.END)
    position.set("")
    team.set("")

def submit():
    data = [pid.get(), name.get(), age.get(), position.get(), jersey.get(), team.get()]

    if "" in data:
        messagebox.showwarning("Warning", "Please fill all fields")
        return

    if any(p[0] == data[0] for p in players):
        messagebox.showerror("Error", "Player ID already exists!")
        return

    players.append(data)
    messagebox.showinfo("Success", "Player Registered Successfully!")
    clear()

def view_records():
    w = tk.Toplevel(root)
    w.title("Player Records")
    w.geometry("750x350")

    cols = ("ID", "Name", "Age", "Position", "Jersey", "Team")
    table = ttk.Treeview(w, columns=cols, show="headings")

    for c in cols:
        table.heading(c, text=c)
        table.column(c, width=110)

    for p in sorted(players, key=lambda x: int(x[0])):
        table.insert("", tk.END, values=p)
```

```
    table.pack(fill="both", expand=True, padx=10, pady=10)

# Main window
root = tk.Tk()
root.title("Football Player Registration")
root.geometry("650x650")
root.configure(bg="#e8f5e9")

tk.Label(root, text="Football Player Registration",
         font=("Arial", 24, "bold"), bg="#1b5e20",
         fg="white", pady=15).pack(fill="x", pady=(0, 25))

form = tk.Frame(root, bg="white", padx=25, pady=20)
form.pack()

fields = ["Player Name:", "Player ID:", "Age:", "Position:",
          "Jersey Number:", "Team:"]

for i, f in enumerate(fields):
    tk.Label(form, text=f, font=("Arial", 13),
             bg="white").grid(row=i, column=0, padx=10, pady=10, sticky="w")

name = tk.Entry(form, width=30, font=("Arial", 12))
pid = tk.Entry(form, width=30, font=("Arial", 12))
age = tk.Entry(form, width=30, font=("Arial", 12))
jersey = tk.Entry(form, width=30, font=("Arial", 12))

position = ttk.Combobox(form,
    values=["Goalkeeper", "Defender", "Midfielder", "Forward"],
    width=42, state="readonly")

team = ttk.Combobox(form,
    values=["Mumbai FC", "Barcelona", "Real Madrid",
            "Manchester United"],
    width=42, state="readonly")

widgets = [name, pid, age, position, jersey, team]

for i, widget in enumerate(widgets):
    widget.grid(row=i, column=1)
```

```
buttons = tk.Frame(root, bg="white")
buttons.pack(pady=30)

tk.Button(buttons, text="Submit", command=submit,
          bg="#2e7d32", fg="white", width=12).grid(row=0, column=0, padx=15)

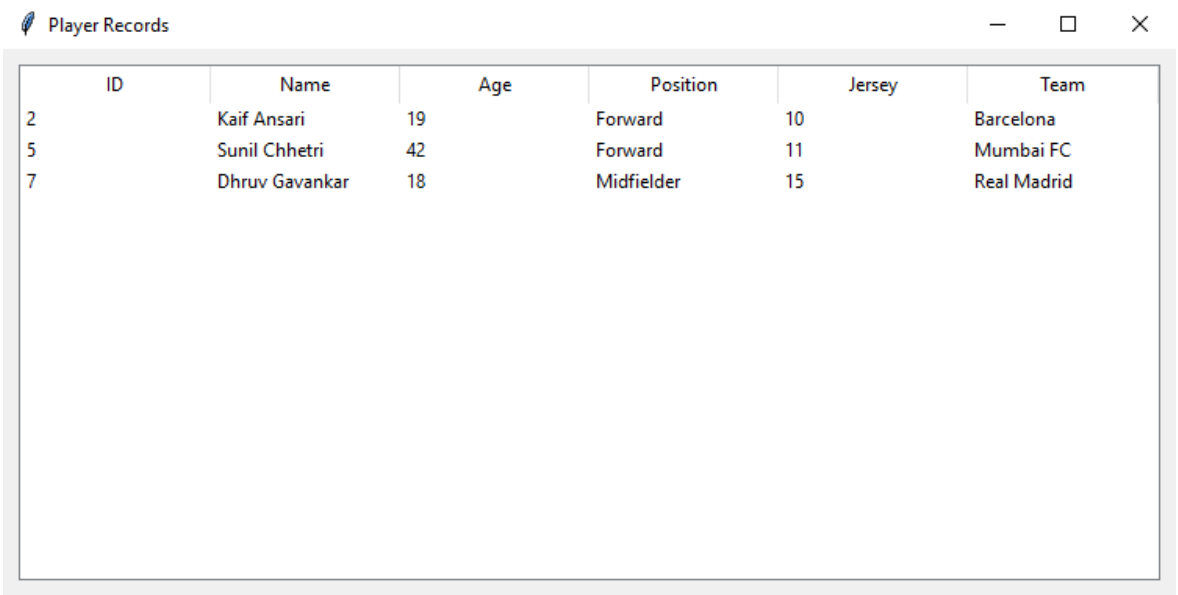

tk.Button(buttons, text="Clear", command=clear,
          bg="#c62828", fg="white", width=12).grid(row=0, column=1, padx=15)

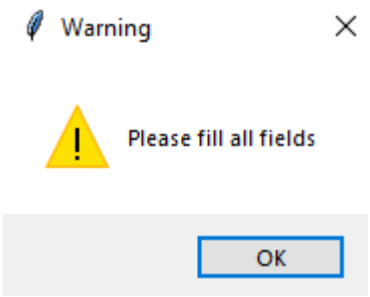

tk.Button(root, text="View Records", command=view_records,
          bg="#1565c0", fg="white", width=28).pack()

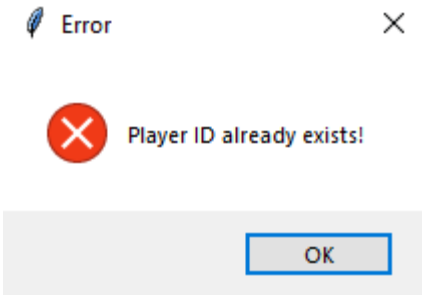

root.mainloop()
```

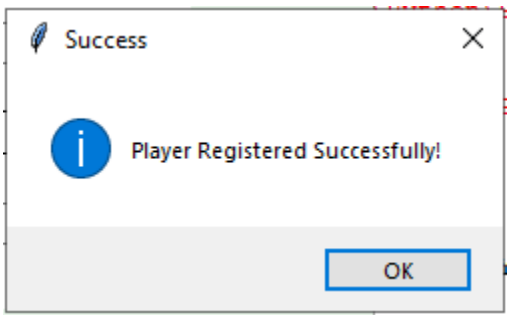

Output:

Football Player Registration
Football Player Registration
Player Name:
Sunil Chhetri
Player ID:
